```

## **SYNOPSIS**

```
#include <archive_entry.h>
void
archive_entry_acl_add_entry(struct archive_entry *a, int type, int permset,
    int tag, int qualifier, const char *name);
archive_entry_acl_add_entry_w(struct archive_entry *a, int type,
    int permset,int tag,int qualifier,const wchar_t *name);
archive_entry_acl_clear(struct archive_entry *a);
archive_entry_acl_count(struct archive_entry *a, int type);
int
archive_entry_acl_next(struct archive_entry *a, int type, int *ret_type,
    int *ret_permset, int *ret_tag, int *ret_qual, const char **ret_name);
int
archive_entry_acl_next_w(struct archive_entry *a, int type, int *ret_type,
    int *ret_permset, int *ret_tag, int *ret_qual, const wchar_t **ret_name);
int
archive_entry_acl_reset(struct archive_entry *a, int type);
const wchar_t *
archive_entry_acl_text_w(struct archive_entry *a, int flags);
```

# DESCRIPTION

An "Access Control List" is a generalisation of the classic Unix permission system. The ACL interface of **libarchive** is derived from the POSIX.1e draft, but restricted to simplify dealing with practical implementations in various Operating Systems and archive formats.

An ACL consists of a number of independent entries. Each entry specifies the permission set as bitmask of basic permissions. Valid permissions are:

```
ARCHIVE_ENTRY_ACL_EXECUTE
ARCHIVE_ENTRY_ACL_WRITE
ARCHIVE_ENTRY_ACL_READ
```

The permissions correspond to the normal Unix permissions.

The tag specifies the principal to which the permission applies. Valid values are:

```
ARCHIVE_ENTRY_ACL_USER The user specified by the name field.
```

ARCHIVE\_ENTRY\_ACL\_USER\_OBJ The owner of the file.

ARCHIVE\_ENTRY\_ACL\_GROUP The group specied by the name field.

ARCHIVE ENTRY ACL GROUP OBJ The group who owns the file.

ARCHIVE\_ENTRY\_ACL\_MASK The maximum permissions to be obtained via group permissions.

ARCHIVE\_ENTRY\_ACL\_OTHER Any principal who doesn't have a user or group entry.

The principals ARCHIVE\_ENTRY\_ACL\_USER\_OBJ, ARCHIVE\_ENTRY\_ACL\_GROUP\_OBJ and ARCHIVE\_ENTRY\_ACL\_OTHER are equivalent to user, group and other in the classic Unix permission model and specify non-extended ACL entries.

All files have an access ACL (ARCHIVE\_ENTRY\_ACL\_TYPE\_ACCESS). This specifies the permissions required for access to the file itself. Directories have an additional ACL (ARCHIVE\_ENTRY\_ACL\_TYPE\_DEFAULT), which controls the initial access ACL for newly created directory entries.

archive\_entry\_acl\_add\_entry() and archive\_entry\_acl\_add\_entry\_w() add a single ACL entry. For the access ACL and non-extended principals, the classic Unix permissions are updated.

archive\_entry\_acl\_clear() removes all ACL entries and resets the enumeration pointer.

**archive\_entry\_acl\_count**() counts the ACL entries that have the given type mask. *type* can be the bitwise-or of ARCHIVE\_ENTRY\_ACL\_TYPE\_ACCESS and ARCHIVE\_ENTRY\_ACL\_TYPE\_DEFAULT. If ARCHIVE\_ENTRY\_ACL\_TYPE\_ACCESS is included and at least one extended ACL entry is found, the three non-extened ACLs are added.

archive\_entry\_acl\_next() and archive\_entry\_acl\_next\_w() return the next entry of the ACL list. This functions may only be called after archive\_entry\_acl\_reset() has indicated the presence of extended ACL entries.

archive\_entry\_acl\_reset() prepare reading the list of ACL entries with
archive\_entry\_acl\_next() or archive\_entry\_acl\_next\_w(). The function returns either 0, if
no non-extended ACLs are found. In this case, the access permissions should be obtained by
archive\_entry\_mode(3) or set using chmod(2). Otherwise, the function returns the same value as
archive\_entry\_acl\_count().

archive\_entry\_acl\_text\_w() converts the ACL entries for the given type mask into a wide string. In
addition to the normal type flags, ARCHIVE\_ENTRY\_ACL\_STYLE\_EXTRA\_ID and
ARCHIVE\_ENTRY\_ACL\_STYLE\_MARK\_DEFAULT can be specified to further customize the result. The
returned long string is valid until the next call to archive\_entry\_acl\_clear(),
archive\_entry\_acl\_add\_entry(), archive\_entry\_acl\_add\_entry\_w() or
archive\_entry\_acl\_text\_w().

### **RETURN VALUES**

archive\_entry\_acl\_count() and archive\_entry\_acl\_reset() returns the number of ACL
entries that match the given type mask. If the type mask includes
ARCHIVE\_ENTRY\_ACL\_TYPE\_ACCESS and at least one extended ACL entry exists, the three classic
Unix permissions are counted.

archive\_entry\_acl\_next() and archive\_entry\_acl\_next\_w() return ARCHIVE\_OK on success, ARCHIVE\_EOF if no more ACL entries exist and ARCHIVE\_WARN if
archive\_entry\_acl\_reset() has not been called first.

archive\_entry\_text\_w() returns a wide string representation of the ACL entrise matching the given
type mask. The returned long string is valid until the next call to archive\_entry\_acl\_clear(),
archive\_entry\_acl\_add\_entry(), archive\_entry\_acl\_add\_entry\_w() or
archive\_entry\_acl\_text\_w().

#### **SEE ALSO**

archive(3), archive\_entry(3)

### **BUGS**

ARCHIVE\_ENTRY\_ACL\_STYLE\_EXTRA\_ID and ARCHIVE\_ENTRY\_ACL\_STYLE\_MARK\_DEFAULT are not documented.
