times in archive entry descriptions
```

SYNOPSIS

```
#include <archive_entry.h>
time t
archive_entry_atime(struct archive_entry *a);
archive_entry_atime_nsec(struct archive_entry *a);
archive_entry_atime_is_set(struct archive_entry *a);
{\tt archive\_entry\_set\_atime}(struct\ archive\_entry\ *a,\ time\_t\ sec,\ long\ nanosec);
archive_entry_unset_atime(struct archive_entry *a);
time t
archive_entry_birthtime(struct archive_entry *a);
archive_entry_birthtime_nsec(struct archive_entry *a);
archive_entry_birthtime_is_set(struct archive_entry *a);
archive_entry_set_birthtime(struct archive_entry *a, time_t sec,
    long nanosec);
void
archive_entry_unset_birthtime(struct archive_entry *a);
time_t
archive_entry_ctime(struct archive_entry *a);
archive_entry_ctime_nsec(struct archive_entry *a);
int
archive_entry_ctime_is_set(struct archive_entry *a);
archive_entry_set_ctime(struct archive_entry *a, time_t sec, long nanosec);
archive_entry_unset_ctime(struct archive_entry *a);
archive_entry_mtime(struct archive_entry *a);
```

```
long
archive_entry_mtime_nsec(struct archive_entry *a);
int
archive_entry_mtime_is_set(struct archive_entry *a);
void
archive_entry_set_mtime(struct archive_entry *a, time_t sec, long nanosec);
void
archive_entry_unset_mtime(struct archive_entry *a);
```

DESCRIPTION

These functions create and manipulate the time fields in an archive_entry. Supported time fields are atime (access time), birthtime (creation time), ctime (last time an inode property was changed) and mtime (modification time).

libarchive(3) provides a high-resolution interface. The timestamps are truncated automatically depending on the archive format (for archiving) or the filesystem capabilities (for restoring).

All timestamp fields are optional. The **XXX_unset**() functions can be used to mark the corresponding field as missing. The current state can be queried using **XXX_is_set**(). Unset time fields have a second and nanosecond field of 0.
